

Data Mining

Chapter 6 Association Analysis: Advance Concepts

Introduction to Data Mining, 2nd Edition
by
Tan, Steinbach, Karpatne, Kumar

1

Data Mining **Association Analysis: Advanced Concepts**

Extensions of Association Analysis to
Continuous and Categorical Attributes and
Multi-level Rules

2

Continuous and Categorical Attributes

How to apply association analysis to non-symmetric binary variables?

| Gender | ... | Age | Annual Income | No of hours spent online per week | No of email accounts | Privacy Concern |
|--------|-----|-----|---------------|-----------------------------------|----------------------|-----------------|
| Female | ... | 26 | 90K | 20 | 4 | Yes |
| Male | ... | 51 | 135K | 10 | 2 | No |
| Male | ... | 29 | 80K | 10 | 3 | Yes |
| Female | ... | 45 | 120K | 15 | 3 | Yes |
| Female | ... | 31 | 95K | 20 | 5 | Yes |
| Male | ... | 25 | 55K | 25 | 5 | Yes |
| Male | ... | 37 | 100K | 10 | 1 | No |
| Male | ... | 41 | 65K | 8 | 2 | No |
| Female | ... | 26 | 85K | 12 | 1 | No |
| ... | ... | ... | ... | ... | ... | ... |

Example of Association Rule:

$\{\text{Gender=Male, Age} \in [21,30]\} \rightarrow \{\text{No of hours online} \geq 10\}$

Handling Categorical Attributes

● Example: Internet Usage Data

| Gender | Level of Education | State | Computer at Home | Online Auction | Chat Online | Online Banking | Privacy Concerns |
|--------|--------------------|------------|------------------|----------------|-------------|----------------|------------------|
| Female | Graduate | Illinois | Yes | Yes | Daily | Yes | Yes |
| Male | College | California | No | No | Never | No | No |
| Male | Graduate | Michigan | Yes | Yes | Monthly | Yes | Yes |
| Female | College | Virginia | No | Yes | Never | Yes | Yes |
| Female | Graduate | California | Yes | No | Never | No | Yes |
| Male | College | Minnesota | Yes | Yes | Weekly | Yes | Yes |
| Male | College | Alaska | Yes | Yes | Daily | Yes | No |
| Male | High School | Oregon | Yes | No | Never | No | No |
| Female | Graduate | Texas | No | No | Monthly | No | No |
| ... | ... | ... | ... | ... | ... | ... | ... |

$\{\text{Level of Education=Graduate, Online Banking=Yes}\} \rightarrow \{\text{Privacy Concerns} = \text{Yes}\}$

Handling Categorical Attributes

- Introduce a new “item” for each distinct attribute-value pair

| Male | Female | Education = Graduate | Education = College | Education = High School | ... | Privacy = Yes | Privacy = No |
|------|--------|-------------------------|------------------------|----------------------------|-----|------------------|-----------------|
| 0 | 1 | 1 | 0 | 0 | ... | 1 | 0 |
| 1 | 0 | 0 | 1 | 0 | ... | 0 | 1 |
| 1 | 0 | 1 | 0 | 0 | ... | 1 | 0 |
| 0 | 1 | 0 | 1 | 0 | ... | 1 | 0 |
| 0 | 1 | 1 | 0 | 0 | ... | 1 | 0 |
| 1 | 0 | 0 | 1 | 0 | ... | 1 | 0 |
| 1 | 0 | 0 | 0 | 0 | ... | 0 | 1 |
| 1 | 0 | 0 | 0 | 1 | ... | 0 | 1 |
| 0 | 1 | 1 | 0 | 0 | ... | 0 | 1 |
| ... | ... | ... | ... | ... | ... | ... | ... |

Handling Categorical Attributes

- Some attributes can have many possible values
 - Many of their attribute values have very low support
 - ◆ Potential solution: Aggregate the low-support attribute values

Handling Categorical Attributes

- Distribution of attribute values can be highly skewed
 - Example: 85% of survey participants own a computer at home
 - ◆ Most records have Computer at home = Yes
 - ◆ Computation becomes expensive; many frequent itemsets involving the binary item (Computer at home = Yes)
 - ◆ Potential solution:
 - discard the highly frequent items
 - Use alternative measures such as h-confidence
- Computational Complexity
 - Binarizing the data increases the number of items
 - But the width of the “transactions” remain the same as the number of original (non-binarized) attributes
 - Produce more frequent itemsets but maximum size of frequent itemset is limited to the number of original attributes

Handling Continuous Attributes

- Different methods:
 - Discretization-based
 - Statistics-based
 - Non-discretization based
 - ◆ minApriori
- Different kinds of rules can be produced:
 - {Age \in [21,30), No of hours online \in [10,20)}
→ {Chat Online =Yes}
 - {Age \in [15,30), Covid-Positive = Yes}
→ Full_recovery

Discretization-based Methods

| Gender | ... | Age | Annual Income | No of hours spent online per week | No of email accounts | Privacy Concern |
|--------|-----|-----|---------------|-----------------------------------|----------------------|-----------------|
| Female | ... | 26 | 90K | 20 | 4 | Yes |
| Male | ... | 51 | 135K | 10 | 2 | No |
| Male | ... | 29 | 80K | 10 | 3 | Yes |
| Female | ... | 45 | 120K | 15 | 3 | Yes |
| Female | ... | 31 | 95K | 20 | 5 | Yes |
| Male | ... | 25 | 55K | 25 | 5 | Yes |
| Male | ... | 37 | 100K | 10 | 1 | No |
| Male | ... | 41 | 65K | 8 | 2 | No |
| Female | ... | 26 | 85K | 12 | 1 | No |
| ... | ... | ... | ... | ... | ... | ... |

| Male | Female | ... | Age < 13 | Age ∈ [13, 21) | Age ∈ [21, 30) | ... | Privacy = Yes | Privacy = No |
|------|--------|-----|----------|----------------|----------------|-----|---------------|--------------|
| 0 | 1 | ... | 0 | 0 | 1 | ... | 1 | 0 |
| 1 | 0 | ... | 0 | 0 | 0 | ... | 0 | 1 |
| 1 | 0 | ... | 0 | 0 | 1 | ... | 1 | 0 |
| 0 | 1 | ... | 0 | 0 | 0 | ... | 1 | 0 |
| 0 | 1 | ... | 0 | 0 | 0 | ... | 1 | 0 |
| 1 | 0 | ... | 0 | 0 | 1 | ... | 1 | 0 |
| 1 | 0 | ... | 0 | 0 | 0 | ... | 0 | 1 |
| 1 | 0 | ... | 0 | 0 | 0 | ... | 0 | 1 |
| 0 | 1 | ... | 0 | 0 | 1 | ... | 0 | 1 |
| ... | ... | ... | ... | ... | ... | ... | ... | ... |

Discretization-based Methods

● Unsupervised:

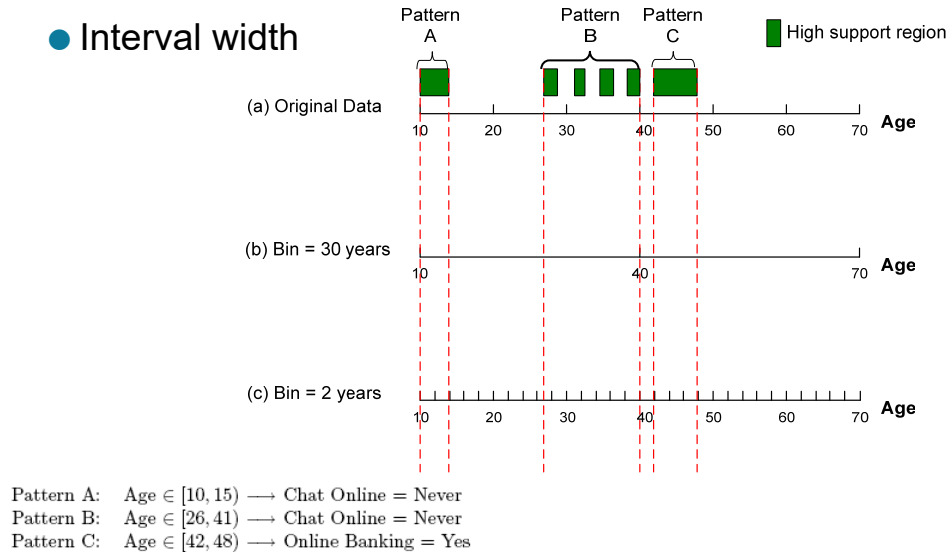

- Equal-width binning <1 2 3> <4 5 6> <7 8 9>
- Equal-depth binning <1 2> <3 4 5 6 7> <8 9>
- Cluster-based

● Supervised discretization

| Continuous attribute, v | | | | | | | | | |
|---|-----|-----|----|----|----|-----|-----|-----|-----|
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| Chat Online = Yes | 0 | 0 | 20 | 10 | 20 | 0 | 0 | 0 | 0 |
| Chat Online = No | 150 | 100 | 0 | 0 | 0 | 100 | 100 | 150 | 100 |
| <div style="display: flex; justify-content: space-around; margin-top: 10px;"> bin₁ bin₂ bin₃ </div> | | | | | | | | | |

Discretization Issues

- Interval width

3/15/2021 Introduction to Data Mining, 2nd Edition

11

11

Discretization Issues

- Interval too wide (e.g., Bin size= 30)

- May merge several disparate patterns
 - ◆ Patterns A and B are merged together
- May lose some of the interesting patterns
 - ◆ Pattern C may not have enough confidence

- Interval too narrow (e.g., Bin size = 2)

- Pattern A is broken up into two smaller patterns
 - ◆ Can recover the pattern by merging adjacent subpatterns
- Pattern B is broken up into smaller patterns
 - ◆ Cannot recover the pattern by merging adjacent subpatterns
- Some windows may not meet support threshold

3/15/2021 Introduction to Data Mining, 2nd Edition

12

12

Discretization: all possible intervals

Number of intervals = k
Total number of Adjacent intervals = $k(k-1)/2$

● Execution time

- If the range is partitioned into k intervals, there are $O(k^2)$ new items
- If an interval $[a,b)$ is frequent, then all intervals that subsume $[a,b)$ must also be frequent
 - ◆ E.g.: if $\{\text{Age} \in [21,25), \text{Chat Online}=\text{Yes}\}$ is frequent, then $\{\text{Age} \in [10,50), \text{Chat Online}=\text{Yes}\}$ is also frequent
- Improve efficiency:
 - ◆ Use maximum support to avoid intervals that are too wide

Statistics-based Methods

● Example:

$\{\text{Income} > 100K, \text{Online Banking}=\text{Yes}\} \rightarrow \text{Age}: \mu=34$

● Rule consequent consists of a continuous variable, characterized by their statistics

- mean, median, standard deviation, etc.

● Approach:

- Withhold the target attribute from the rest of the data
- Extract frequent itemsets from the rest of the attributes
 - ◆ Binarize the continuous attributes (except for the target attribute)
- For each frequent itemset, compute the corresponding descriptive statistics of the target attribute
 - ◆ Frequent itemset becomes a rule by introducing the target variable as rule consequent
- Apply statistical test to determine interestingness of the rule

Statistics-based Methods

| Gender | ... | Age | Annual Income | No of hours spent online per week | No of email accounts | Privacy Concern |
|--------|-----|-----|---------------|-----------------------------------|----------------------|-----------------|
| Female | ... | 26 | 90K | 20 | 4 | Yes |
| Male | ... | 51 | 135K | 10 | 2 | No |
| Male | ... | 29 | 80K | 10 | 3 | Yes |
| Female | ... | 45 | 120K | 15 | 3 | Yes |
| Female | ... | 31 | 95K | 20 | 5 | Yes |
| Male | ... | 25 | 55K | 25 | 5 | Yes |
| Male | ... | 37 | 100K | 10 | 1 | No |
| Male | ... | 41 | 65K | 8 | 2 | No |
| Female | ... | 26 | 85K | 12 | 1 | No |
| ... | ... | ... | ... | ... | ... | ... |

Frequent Itemsets:

{Male, Income > 100K}
 {Income < 30K, No hours ∈ [10,15]}
 {Income > 100K, Online Banking = Yes}

Association Rules:

{Male, Income > 100K} → Age: $\mu = 30$
 {Income < 40K, No hours ∈ [10,15]} → Age: $\mu = 24$
 {Income > 100K, Online Banking = Yes} → Age: $\mu = 34$

Statistics-based Methods

● How to determine whether an association rule interesting?

- Compare the statistics for segment of population covered by the rule vs segment of population not covered by the rule:

$$A \Rightarrow B: \mu \quad \text{versus} \quad \bar{A} \Rightarrow B: \mu'$$

- Statistical hypothesis testing:

- ◆ Null hypothesis: $H_0: \mu' = \mu + \Delta$
- ◆ Alternative hypothesis: $H_1: \mu' > \mu + \Delta$
- ◆ Z has zero mean and variance 1 under null hypothesis

$$Z = \frac{\mu' - \mu - \Delta}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

Statistics-based Methods

- Example:

r: Covid-Positive & Quick_Recovery=Yes → Age: $\mu=23$

- Rule is interesting if difference between μ and μ' is more than 5 years (i.e., $\Delta = 5$)
- For r, suppose $n_1 = 50$, $s_1 = 3.5$
- For r' (complement): $n_2 = 250$, $s_2 = 6.5$

$$Z = \frac{\mu' - \mu - \Delta}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}} = \frac{30 - 23 - 5}{\sqrt{\frac{3.5^2}{50} + \frac{6.5^2}{250}}} = 3.11$$

- For 1-sided test at 95% confidence level, critical Z-value for rejecting null hypothesis is 1.64.
- Since Z is greater than 1.64, r is an interesting rule

Min-Apriori

Document-term matrix:

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|----|----|----|----|----|
| D1 | 2 | 2 | 0 | 0 | 1 |
| D2 | 0 | 0 | 1 | 2 | 2 |
| D3 | 2 | 3 | 0 | 0 | 0 |
| D4 | 0 | 0 | 1 | 0 | 1 |
| D5 | 1 | 1 | 1 | 0 | 2 |

Example:

W1 and W2 tends to appear together in the same document

Min-Apriori

- Data contains only continuous attributes of the same “type”

- e.g., frequency of words in a document

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|----|----|----|----|----|
| D1 | 2 | 2 | 0 | 0 | 1 |
| D2 | 0 | 0 | 1 | 2 | 2 |
| D3 | 2 | 3 | 0 | 0 | 0 |
| D4 | 0 | 0 | 1 | 0 | 1 |
| D5 | 1 | 1 | 1 | 0 | 2 |

- Potential solution:

- Convert into 0/1 matrix and then apply existing algorithms
 - ◆ lose word frequency information
- Discretization does not apply as users want association among words based on how frequently they co-occur, not if they occur with similar frequencies

Min-Apriori

- How to determine the support of a word?

- If we simply sum up its frequency, support count will be greater than total number of documents!
 - ◆ Normalize the word vectors – e.g., using L_1 norms
 - ◆ Each word has a support equals to 1.0

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|----|----|----|----|----|
| D1 | 2 | 2 | 0 | 0 | 1 |
| D2 | 0 | 0 | 1 | 2 | 2 |
| D3 | 2 | 3 | 0 | 0 | 0 |
| D4 | 0 | 0 | 1 | 0 | 1 |
| D5 | 1 | 1 | 1 | 0 | 2 |

Normalize

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|------|------|------|------|------|
| D1 | 0.40 | 0.33 | 0.00 | 0.00 | 0.17 |
| D2 | 0.00 | 0.00 | 0.33 | 1.00 | 0.33 |
| D3 | 0.40 | 0.50 | 0.00 | 0.00 | 0.00 |
| D4 | 0.00 | 0.00 | 0.33 | 0.00 | 0.17 |
| D5 | 0.20 | 0.17 | 0.33 | 0.00 | 0.33 |

Min-Apriori

- New definition of support:

$$\text{sup}(C) = \sum_{i \in T} \min_{j \in C} D(i, j)$$

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|------|------|------|------|------|
| D1 | 0.40 | 0.33 | 0.00 | 0.00 | 0.17 |
| D2 | 0.00 | 0.00 | 0.33 | 1.00 | 0.33 |
| D3 | 0.40 | 0.50 | 0.00 | 0.00 | 0.00 |
| D4 | 0.00 | 0.00 | 0.33 | 0.00 | 0.17 |
| D5 | 0.20 | 0.17 | 0.33 | 0.00 | 0.33 |

Example:

Sup(W1, W2)

$$= .33 + 0 + .4 + 0 + 0.17$$

$$= 0.9$$

Anti-monotone property of Support

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|------|------|------|------|------|
| D1 | 0.40 | 0.33 | 0.00 | 0.00 | 0.17 |
| D2 | 0.00 | 0.00 | 0.33 | 1.00 | 0.33 |
| D3 | 0.40 | 0.50 | 0.00 | 0.00 | 0.00 |
| D4 | 0.00 | 0.00 | 0.33 | 0.00 | 0.17 |
| D5 | 0.20 | 0.17 | 0.33 | 0.00 | 0.33 |

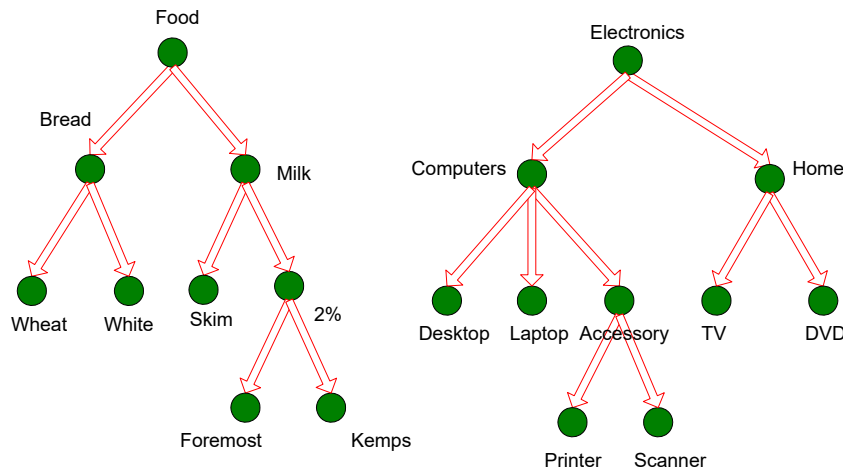

Example:

$$\text{Sup}(W1) = 0.4 + 0 + 0.4 + 0 + 0.2 = 1$$

$$\text{Sup}(W1, W2) = 0.33 + 0 + 0.4 + 0 + 0.17 = 0.9$$

$$\text{Sup}(W1, W2, W3) = 0 + 0 + 0 + 0 + 0.17 = 0.17$$

Concept Hierarchies

3/15/2021 Introduction to Data Mining, 2nd Edition

23

23

Multi-level Association Rules

- Why should we incorporate concept hierarchy?
 - Rules at lower levels may not have enough support to appear in any frequent itemsets
 - Rules at lower levels of the hierarchy are overly specific
 - ◆ e.g., following rules are indicative of association between milk and bread
 - skim milk → white bread,
 - 2% milk → wheat bread,
 - skim milk → wheat bread, etc.
 - Rules at higher level of hierarchy may be too generic
 - ◆ e.g., electronics → food

3/15/2021 Introduction to Data Mining, 2nd Edition

24

24

Multi-level Association Rules

- How do support and confidence vary as we traverse the concept hierarchy?

- If $\sigma(X1 \cup Y1) \geq \text{minsup}$,
and X is parent of $X1$, Y is parent of $Y1$
then $\sigma(X \cup Y1) \geq \text{minsup}$, $\sigma(X1 \cup Y) \geq \text{minsup}$
 $\sigma(X \cup Y) \geq \text{minsup}$
- If $\text{conf}(X1 \Rightarrow Y1) \geq \text{minconf}$,
then $\text{conf}(X1 \Rightarrow Y) \geq \text{minconf}$

$$\frac{\sigma(X1, Y1)}{\sigma(X1)} \quad \text{and} \quad \frac{\sigma(X1, Y)}{\sigma(X1)}$$

Multi-level Association Rules

- Approach 1:
 - Extend current association rule formulation by augmenting each transaction with higher level items

Original Transaction: {skim milk, wheat bread}

Augmented Transaction:

{skim milk, wheat bread, milk, bread, food}

- Issues:
 - Items that reside at higher levels have much higher support counts
 - if support threshold is low, too many frequent patterns involving items from the higher levels
 - Increased dimensionality of the data

Multi-level Association Rules

- Approach 2:
 - Generate frequent patterns at highest level first
 - Then, generate frequent patterns at the next highest level, and so on
- Issues:
 - I/O requirements will increase dramatically because we need to perform more passes over the data
 - May miss some potentially interesting cross-level association patterns

Data Mining Association Analysis: Advanced Concepts

Sequential Patterns

Examples of Sequence

- Sequence of different transactions by a customer at an online store:

< {Digital Camera,iPad} {memory card} {headphone,iPad cover} >

- Sequence of initiating events causing the nuclear accident at 3-mile Island:

(http://stellar-one.com/nuclear/staff_reports/summary_SOE_the_initiating_event.htm)

< {clogged resin} {outlet valve closure} {loss of feedwater}
{condenser polisher outlet valve shut} {booster pumps trip}
{main waterpump trips} {main turbine trips} {reactor pressure increases}>

- Sequence of books checked out at a library:

<{Fellowship of the Ring} {The Two Towers} {Return of the King}>

Sequential Pattern Discovery: Examples

- In telecommunications alarm logs,
 - Inverter_Problem:
(Excessive_Line_Current) (Rectifier_Alarm) --> (Fire_Alarm)
- In point-of-sale transaction sequences,
 - Computer Bookstore:
(Intro_To_Visual_C) (C++_Primer) -->
(Perl_for_dummies,Tcl_Tk)
 - Athletic Apparel Store:
(Shoes) (Racket, Racketball) --> (Sports_Jacket)

Sequence Data

| Sequence Database | Sequence | Element (Transaction) | Event (Item) |
|-------------------|---|--|--|
| Customer | Purchase history of a given customer | A set of items bought by a customer at time t | Books, diary products, CDs, etc |
| Web Data | Browsing activity of a particular Web visitor | A collection of files viewed by a Web visitor after a single mouse click | Home page, index page, contact info, etc |
| Event data | History of events generated by a given sensor | Events triggered by a sensor at time t | Types of alarms generated by sensors |
| Genome sequences | DNA sequence of a particular species | An element of the DNA sequence | Bases A,T,G,C |

31

Sequence Data

Sequence Database:

| Sequence ID | Timestamp | Events |
|-------------|-----------|------------|
| A | 10 | 2, 3, 5 |
| A | 20 | 6, 1 |
| A | 23 | 1 |
| B | 11 | 4, 5, 6 |
| B | 17 | 2 |
| B | 21 | 7, 8, 1, 2 |
| B | 28 | 1, 6 |
| C | 14 | 1, 8, 7 |

32

Sequence Data vs. Market-basket Data

Sequence Database:

| Customer | Date | Items bought |
|----------|------|--------------|
| A | 10 | 2, 3, 5 |
| A | 20 | 1,6 |
| A | 23 | 1 |
| B | 11 | 4, 5, 6 |
| B | 17 | 2 |
| B | 21 | 1,2,7,8 |
| B | 28 | 1, 6 |
| C | 14 | 1,7,8 |

Market- basket Data

| Events |
|---------|
| 2, 3, 5 |
| 1,6 |
| 1 |
| 4,5,6 |
| 2 |
| 1,2,7,8 |
| 1,6 |
| 1,7,8 |

Sequence Data vs. Market-basket Data

Sequence Database:

| Customer | Date | Items bought |
|----------|------|--------------|
| A | 10 | 2, 3, 5 |
| A | 20 | 1,6 |
| A | 23 | 1 |
| B | 11 | 4, 5, 6 |
| B | 17 | 2 |
| B | 21 | 1,2,7,8 |
| B | 28 | 1, 6 |
| C | 14 | 1,7,8 |

Market- basket Data

| Events |
|---------|
| 2, 3, 5 |
| 1,6 |
| 1 |
| 4,5,6 |
| 2 |
| 1,2,7,8 |
| 1,6 |
| 1,7,8 |

Formal Definition of a Sequence

- A sequence is an ordered list of elements

$$s = \langle e_1 e_2 e_3 \dots \rangle$$

- Each element contains a collection of events (items)

$$e_i = \{i_1, i_2, \dots, i_k\}$$

- Length of a sequence, $|s|$, is given by the number of elements in the sequence
- A k-sequence is a sequence that contains k events (items)
 - $\langle \{a,b\} \{a\} \rangle$ has a length of 2 and it is a 3-sequence

Formal Definition of a Subsequence

- A sequence $t: \langle a_1 a_2 \dots a_n \rangle$ **is contained** in another sequence $s: \langle b_1 b_2 \dots b_m \rangle$ ($m \geq n$) if there exist integers $i_1 < i_2 < \dots < i_n$ such that $a_1 \subseteq b_{i_1}, a_2 \subseteq b_{i_2}, \dots, a_n \subseteq b_{i_n}$

- Illustrative Example:

$s:$ b_1 b_2 b_3 b_4 b_5
 $t:$ a_1 a_2 a_3

t is a subsequence of s if $a_1 \subseteq b_2, a_2 \subseteq b_3, a_3 \subseteq b_5$.

| Data sequence | Subsequence | Contain? |
|---|-------------------------------------|----------|
| $\langle \{2,4\} \{3,5,6\} \{8\} \rangle$ | $\langle \{2\} \{8\} \rangle$ | Yes |
| $\langle \{1,2\} \{3,4\} \rangle$ | $\langle \{1\} \{2\} \rangle$ | No |
| $\langle \{2,4\} \{2,4\} \{2,5\} \rangle$ | $\langle \{2\} \{4\} \rangle$ | Yes |
| $\langle \{2,4\} \{2,5\} \{4,5\} \rangle$ | $\langle \{2\} \{4\} \{5\} \rangle$ | No |
| $\langle \{2,4\} \{2,5\} \{4,5\} \rangle$ | $\langle \{2\} \{5\} \{5\} \rangle$ | Yes |
| $\langle \{2,4\} \{2,5\} \{4,5\} \rangle$ | $\langle \{2, 4, 5\} \rangle$ | No |

Sequential Pattern Mining: Definition

- The support of a subsequence w is defined as the fraction of data sequences that contain w
- A *sequential pattern* is a frequent subsequence (i.e., a subsequence whose support is $\geq \text{minsup}$)
- Given:
 - a database of sequences
 - a user-specified minimum support threshold, minsup
- Task:
 - Find all subsequences with support $\geq \text{minsup}$

Sequential Pattern Mining: Example

| Object | Timestamp | Events |
|--------|-----------|---------|
| A | 1 | 1,2,4 |
| A | 2 | 2,3 |
| A | 3 | 5 |
| B | 1 | 1,2 |
| B | 2 | 2,3,4 |
| C | 1 | 1, 2 |
| C | 2 | 2,3,4 |
| C | 3 | 2,4,5 |
| D | 1 | 2 |
| D | 2 | 3, 4 |
| D | 3 | 4, 5 |
| E | 1 | 1, 3 |
| E | 2 | 2, 4, 5 |

$\text{Minsup} = 50\%$

Examples of Frequent Subsequences:

| | |
|-----------------------------------|----------|
| $\langle \{1,2\} \rangle$ | $s=60\%$ |
| $\langle \{2,3\} \rangle$ | $s=60\%$ |
| $\langle \{2,4\} \rangle$ | $s=80\%$ |
| $\langle \{3\} \{5\} \rangle$ | $s=80\%$ |
| $\langle \{1\} \{2\} \rangle$ | $s=80\%$ |
| $\langle \{2\} \{2\} \rangle$ | $s=60\%$ |
| $\langle \{1\} \{2,3\} \rangle$ | $s=60\%$ |
| $\langle \{2\} \{2,3\} \rangle$ | $s=60\%$ |
| $\langle \{1,2\} \{2,3\} \rangle$ | $s=60\%$ |

Sequence Data vs. Market-basket Data

Sequence Database:

| Customer | Date | Items bought |
|----------|------|--------------|
| A | 10 | 2, 3, 5 |
| A | 20 | 1, 6 |
| A | 23 | 1 |
| B | 11 | 4, 5, 6 |
| B | 17 | 2 |

Extracting Sequential Patterns

- Given n events: $i_1, i_2, i_3, \dots, i_n$
- Candidate 1-subsequences:
 $\langle \{i_1\} \rangle, \langle \{i_2\} \rangle, \langle \{i_3\} \rangle, \dots, \langle \{i_n\} \rangle$
- Candidate 2-subsequences:
 $\langle \{i_1, i_2\} \rangle, \langle \{i_1, i_3\} \rangle, \dots,$
 $\langle \{i_1\} \{i_1\} \rangle, \langle \{i_1\} \{i_2\} \rangle, \dots, \langle \{i_n\} \{i_n\} \rangle$
- Candidate 3-subsequences:
 $\langle \{i_1, i_2, i_3\} \rangle, \langle \{i_1, i_2, i_4\} \rangle, \dots,$
 $\langle \{i_1, i_2\} \{i_1\} \rangle, \langle \{i_1, i_2\} \{i_2\} \rangle, \dots,$
 $\langle \{i_1\} \{i_1, i_2\} \rangle, \langle \{i_1\} \{i_1, i_3\} \rangle, \dots,$
 $\langle \{i_1\} \{i_1\} \{i_1\} \rangle, \langle \{i_1\} \{i_1\} \{i_2\} \rangle, \dots$

Extracting Sequential Patterns: Simple example

- Given 2 events: a, b
- Candidate 1-subsequences:
 $\langle \{a\} \rangle, \langle \{b\} \rangle$.
- Candidate 2-subsequences:
 $\langle \{a\} \{a\} \rangle, \langle \{a\} \{b\} \rangle, \langle \{b\} \{a\} \rangle, \langle \{b\} \{b\} \rangle, \langle \{a, b\} \rangle$.
- Candidate 3-subsequences:
 $\langle \{a\} \{a\} \{a\} \rangle, \langle \{a\} \{a\} \{b\} \rangle, \langle \{a\} \{b\} \{a\} \rangle, \langle \{a\} \{b\} \{b\} \rangle,$
 $\langle \{b\} \{b\} \{b\} \rangle, \langle \{b\} \{b\} \{a\} \rangle, \langle \{b\} \{a\} \{b\} \rangle, \langle \{b\} \{a\} \{a\} \rangle$
 $\langle \{a, b\} \{a\} \rangle, \langle \{a, b\} \{b\} \rangle, \langle \{a\} \{a, b\} \rangle, \langle \{b\} \{a, b\} \rangle$

Generalized Sequential Pattern (GSP)

- Step 1:**
 - Make the first pass over the sequence database D to yield all the 1-element frequent sequences
- Step 2:**

Repeat until no new frequent sequences are found

 - Candidate Generation:**
 - Merge pairs of frequent subsequences found in the $(k-1)$ th pass to generate candidate sequences that contain k items
 - Candidate Pruning:**
 - Prune candidate k -sequences that contain infrequent $(k-1)$ -subsequences
 - Support Counting:**
 - Make a new pass over the sequence database D to find the support for these candidate sequences
 - Candidate Elimination:**
 - Eliminate candidate k -sequences whose actual support is less than *minsup*

Candidate Generation

- Base case ($k=2$):

- Merging two frequent 1-sequences $\langle\{i_1\}\rangle$ and $\langle\{i_2\}\rangle$ will produce the following candidate 2-sequences: $\langle\{i_1\} \{i_1\}\rangle$, $\langle\{i_1\} \{i_2\}\rangle$, $\langle\{i_2\} \{i_2\}\rangle$, $\langle\{i_2\} \{i_1\}\rangle$ and $\langle\{i_1, i_2\}\rangle$. (**Note:** $\langle\{i_1\}\rangle$ can be merged with itself to produce: $\langle\{i_1\} \{i_1\}\rangle$)

- General case ($k>2$):

- A frequent $(k-1)$ -sequence w_1 is merged with another frequent $(k-1)$ -sequence w_2 to produce a candidate k -sequence if the subsequence obtained by removing an event from the first element in w_1 is the same as the subsequence obtained by removing an event from the last element in w_2

Candidate Generation

- Base case ($k=2$):

- Merging two frequent 1-sequences $\langle\{i_1\}\rangle$ and $\langle\{i_2\}\rangle$ will produce the following candidate 2-sequences: $\langle\{i_1\} \{i_1\}\rangle$, $\langle\{i_1\} \{i_2\}\rangle$, $\langle\{i_2\} \{i_2\}\rangle$, $\langle\{i_2\} \{i_1\}\rangle$ and $\langle\{i_1, i_2\}\rangle$. (**Note:** $\langle\{i_1\}\rangle$ can be merged with itself to produce: $\langle\{i_1\} \{i_1\}\rangle$)

- General case ($k>2$):

- A frequent $(k-1)$ -sequence w_1 is merged with another frequent $(k-1)$ -sequence w_2 to produce a candidate k -sequence if the subsequence obtained by removing an event from the first element in w_1 is the same as the subsequence obtained by removing an event from the last element in w_2
 - ◆ The resulting candidate after merging is given by extending the sequence w_1 as follows-
 - If the last element of w_2 has only one event, append it to w_1
 - Otherwise add the event from the last element of w_2 (which is absent in the last element of w_1) to the last element of w_1

Candidate Generation Examples

- Merging $w_1 = \langle \{1\} \{2\} \{3\} \{4\} \{6\} \rangle$ and $w_2 = \langle \{2\} \{3\} \{4\} \{6\} \{5\} \rangle$ produces the candidate sequence $\langle \{1\} \{2\} \{3\} \{4\} \{6\} \{5\} \rangle$ because the last element of w_2 has only one event
- Merging $w_1 = \langle \{1\} \{2\} \{3\} \{4\} \rangle$ and $w_2 = \langle \{2\} \{3\} \{4\} \{5\} \rangle$ produces the candidate sequence $\langle \{1\} \{2\} \{3\} \{4\} \{5\} \rangle$ because the last element in w_2 has more than one event
- Merging $w_1 = \langle \{1\} \{2\} \{3\} \rangle$ and $w_2 = \langle \{2\} \{3\} \{4\} \rangle$ produces the candidate sequence $\langle \{1\} \{2\} \{3\} \{4\} \rangle$ because the last element in w_2 has more than one event
- We do not have to merge the sequences $w_1 = \langle \{1\} \{2\} \{6\} \{4\} \rangle$ and $w_2 = \langle \{1\} \{2\} \{4\} \{5\} \rangle$ to produce the candidate $\langle \{1\} \{2\} \{6\} \{4\} \{5\} \rangle$ because if the latter is a viable candidate, then it can be obtained by merging w_1 with $\langle \{2\} \{6\} \{4\} \{5\} \rangle$

Introduction to Data Mining

49

49

Timing Constraints (I)

x_g : max-gap

n_g : min-gap

m_s : maximum span

$x_g = 2, n_g = 0, m_s = 4$

| Data sequence, d | Sequential Pattern, s | d contains s? |
|---------------------------------------|-----------------------|---------------|
| < {2,4} {3,5,6} {4,7} {4,5} {8} > | < {6} {5} > | Yes |
| < {1} {2} {3} {4} {5} > | < {1} {4} > | No |
| < {1} {2,3} {3,4} {4,5} > | < {2} {3} {5} > | Yes |
| < {1,2} {3} {2,3} {3,4} {2,4} {4,5} > | < {1,2} {5} > | No |

3/15/2021

Introduction to Data Mining, 2nd Edition

50

50

Mining Sequential Patterns with Timing Constraints

- Approach 1:
 - Mine sequential patterns without timing constraints
 - Postprocess the discovered patterns
- Approach 2:
 - Modify GSP to directly prune candidates that violate timing constraints
 - Question:
 - ◆ Does Apriori principle still hold?

Apriori Principle for Sequence Data

| Object | Timestamp | Events |
|--------|-----------|---------|
| A | 1 | 1,2,4 |
| A | 2 | 2,3 |
| A | 3 | 5 |
| B | 1 | 1,2 |
| B | 2 | 2,3,4 |
| C | 1 | 1, 2 |
| C | 2 | 2,3,4 |
| C | 3 | 2,4,5 |
| D | 1 | 2 |
| D | 2 | 3, 4 |
| D | 3 | 4, 5 |
| E | 1 | 1, 3 |
| E | 2 | 2, 4, 5 |

Suppose:

$x_g = 1$ (max-gap)

$n_g = 0$ (min-gap)

$m_s = 5$ (maximum span)

$minsup = 60\%$

$\langle \{2\} \{5\} \rangle$ support = 40%

but

$\langle \{2\} \{3\} \{5\} \rangle$ support = 60%

Problem exists because of max-gap constraint

No such problem if max-gap is infinite

Contiguous Subsequences

- s is a contiguous subsequence of $w = \langle e_1 \rangle \langle e_2 \rangle \dots \langle e_k \rangle$ if any of the following conditions hold:
 1. s is obtained from w by deleting an item from either e_1 or e_k
 2. s is obtained from w by deleting an item from any element e_i that contains at least 2 items
 3. s is a contiguous subsequence of s' and s' is a contiguous subsequence of w (recursive definition)
- Examples: $s = \langle \{1\} \{2\} \rangle$
 - is a contiguous subsequence of $\langle \{1\} \{2\} \{3\} \rangle$, $\langle \{1\} \{2\} \{2\} \{3\} \rangle$, and $\langle \{3\} \{4\} \{1\} \{2\} \{2\} \{3\} \{4\} \rangle$
 - is not a contiguous subsequence of $\langle \{1\} \{3\} \{2\} \rangle$ and $\langle \{2\} \{1\} \{3\} \{2\} \rangle$

Modified Candidate Pruning Step

- Without maxgap constraint:
 - A candidate k -sequence is pruned if at least one of its $(k-1)$ -subsequences is infrequent
- With maxgap constraint:
 - A candidate k -sequence is pruned if at least one of its **contiguous** $(k-1)$ -subsequences is infrequent

Timing Constraints (II)

x_g : max-gap

n_g : min-gap

ws: window size

m_s : maximum span

$x_g = 2$, $n_g = 0$, **ws = 1**, $m_s = 5$

| Data sequence, d | Sequential Pattern, s | d contains s? |
|---|-----------------------------------|---------------|
| $\langle \{2,4\} \{3,5,6\} \{4,7\} \{4,5\} \{8\} \rangle$ | $\langle \{3,4,5\} \rangle$ | Yes |
| $\langle \{1\} \{2\} \{3\} \{4\} \{5\} \rangle$ | $\langle \{1,2\} \{3,4\} \rangle$ | No |
| $\langle \{1,2\} \{2,3\} \{3,4\} \{4,5\} \rangle$ | $\langle \{1,2\} \{3,4\} \rangle$ | Yes |

Modified Support Counting Step

- Given a candidate sequential pattern: $\langle \{a, c\} \rangle$
 - Any data sequences that contain
 - $\langle \dots \{a\} \{c\} \dots \rangle$,
 - $\langle \dots \{a\} \dots \{c\} \dots \rangle$ (where $\text{time}(\{c\}) - \text{time}(\{a\}) \leq \text{ws}$)
 - $\langle \dots \{c\} \dots \{a\} \dots \rangle$ (where $\text{time}(\{a\}) - \text{time}(\{c\}) \leq \text{ws}$)
- will contribute to the support count of candidate pattern

Other Formulation

- In some domains, we may have only one very long time series
 - Example:
 - ◆ monitoring network traffic events for attacks
 - ◆ monitoring telecommunication alarm signals
- Goal is to find frequent sequences of events in the time series
 - This problem is also known as frequent episode mining

3/15/2021

Introduction to Data Mining, 2nd Edition

57

57

General Support Counting Schemes

Assume:

$x_g = 2$ (max-gap)

$n_g = 0$ (min-gap)

$ws = 0$ (window size)

$m_s = 2$ (maximum span)

Data Mining

Association Analysis: Advanced Concepts

Subgraph Mining

59

Frequent Subgraph Mining

- Extends association analysis to finding frequent subgraphs
- Useful for Web Mining, computational chemistry, bioinformatics, spatial data sets, etc

60

Graph Definitions

(a) Labeled Graph

(b) Subgraph

(c) Induced Subgraph

Representing Transactions as Graphs

- Each transaction is a clique of items

| Transaction Id | Items |
|----------------|--------------|
| 1 | {A, B, C, D} |
| 2 | {A, B, E} |
| 3 | {B, C} |
| 4 | {A, B, D, E} |
| 5 | {B, C, D} |

Representing Graphs as Transactions

G1

G2

G3

| | (a,b,p) | (a,b,q) | (a,b,r) | (b,c,p) | (b,c,q) | (b,c,r) | ... | (d,e,r) |
|----|---------|---------|---------|---------|---------|---------|-----|---------|
| G1 | 1 | 0 | 0 | 0 | 0 | 1 | ... | 0 |
| G2 | 1 | 0 | 0 | 0 | 0 | 0 | ... | 0 |
| G3 | 0 | 0 | 1 | 1 | 0 | 0 | ... | 0 |
| G3 | ... | ... | ... | ... | ... | ... | ... | ... |

Challenges

- Node may contain duplicate labels
- Support and confidence
 - How to define them?
- Additional constraints imposed by pattern structure
 - Support and confidence are not the only constraints
 - Assumption: frequent subgraphs must be connected
- Apriori-like approach:
 - Use frequent k-subgraphs to generate frequent (k+1) subgraphs
 - ◆ What is k?

Challenges...

- Support:
 - number of graphs that contain a particular subgraph
- Apriori principle still holds
- Level-wise (Apriori-like) approach:
 - Vertex growing:
 - ◆ k is the number of vertices
 - Edge growing:
 - ◆ k is the number of edges

Vertex Growing

Edge Growing

Apriori-like Algorithm

- Find frequent 1-subgraphs
- Repeat
 - Candidate generation
 - ◆ Use frequent $(k-1)$ -subgraphs to generate candidate k -subgraph
 - Candidate pruning
 - ◆ Prune candidate subgraphs that contain infrequent $(k-1)$ -subgraphs
 - Support counting
 - ◆ Count the support of each remaining candidate
 - Eliminate candidate k -subgraphs that are infrequent

In practice, it is not as easy. There are many other issues

Example: Dataset

G1

G2

G3

G4

| | (a,b,p) | (a,b,q) | (a,b,r) | (b,c,p) | (b,c,q) | (b,c,r) | ... | (d,e,r) |
|----|---------|---------|---------|---------|---------|---------|-----|---------|
| G1 | 1 | 0 | 0 | 0 | 0 | 1 | ... | 0 |
| G2 | 1 | 0 | 0 | 0 | 0 | 0 | ... | 0 |
| G3 | 0 | 0 | 1 | 1 | 0 | 0 | ... | 0 |
| G4 | 0 | 0 | 0 | 0 | 0 | 0 | ... | 0 |

Minimum support count = 2

k=1
Frequent
Subgraphs

k=2
Frequent
Subgraphs

k=3
Candidate
Subgraphs

(Pruned candidate
due to low support)

Candidate Generation

- In Apriori:
 - Merging two frequent k -itemsets will produce a candidate $(k+1)$ -itemset
- In frequent subgraph mining (vertex/edge growing)
 - Merging two frequent k -subgraphs may produce more than one candidate $(k+1)$ -subgraph

71

Multiplicity of Candidates (Vertex Growing)

72

Multiplicity of Candidates (Edge growing)

- Case 1: identical vertex labels

Multiplicity of Candidates (Edge growing)

- Case 2: Core contains identical labels

Multiplicity of Candidates (Edge growing)

Case 3: Core multiplicity

76

Candidate Generation by Edge Growing

- Given:

- Case 1: $a \neq c$ and $b \neq d$

$G3 = \text{Merge}(G1, G2)$

Candidate Generation by Edge Growing

- Case 2: $a = c$ and $b \neq d$

$G3 = \text{Merge}(G1, G2)$

$G3 = \text{Merge}(G1, G2)$

Candidate Generation by Edge Growing

- Case 3: $a \neq c$ and $b = d$

$G3 = \text{Merge}(G1, G2)$

$G3 = \text{Merge}(G1, G2)$

Candidate Generation by Edge Growing

- Case 4: $a = c$ and $b = d$

$G3 = \text{Merge}(G1, G2)$

$G3 = \text{Merge}(G1, G2)$

$G3 = \text{Merge}(G1, G2)$

Graph Isomorphism

- A graph is isomorphic if it is topologically equivalent to another graph

Graph Isomorphism

- Test for graph isomorphism is needed:
 - During candidate generation step, to determine whether a candidate has been generated
 - During candidate pruning step, to check whether its $(k-1)$ -subgraphs are frequent
 - During candidate counting, to check whether a candidate is contained within another graph

Graph Isomorphism

| | A(1) | A(2) | A(3) | A(4) | B(5) | B(6) | B(7) | B(8) |
|------|------|------|------|------|------|------|------|------|
| A(1) | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 |
| A(2) | 1 | 1 | 0 | 1 | 0 | 1 | 0 | 0 |
| A(3) | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 |
| A(4) | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 |
| B(5) | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 0 |
| B(6) | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 1 |
| B(7) | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 1 |
| B(8) | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 1 |

| | A(1) | A(2) | A(3) | A(4) | B(5) | B(6) | B(7) | B(8) |
|------|------|------|------|------|------|------|------|------|
| A(1) | 1 | 1 | 0 | 1 | 0 | 1 | 0 | 0 |
| A(2) | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 |
| A(3) | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |
| A(4) | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| B(5) | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 1 |
| B(6) | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| B(7) | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 |
| B(8) | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 1 |

- The same graph can be represented in many ways

Graph Isomorphism

- Use canonical labeling to handle isomorphism
 - Map each graph into an ordered string representation (known as its code) such that two isomorphic graphs will be mapped to the same canonical encoding
 - Example:
 - Lexicographically largest adjacency matrix

Example of Canonical Labeling (Kuramochi & Karypis, ICDM 2001)

- Graph:

- Adjacency matrix representation:

| id | a | b | c | d |
|-------|-------|-------|-------|-------|
| label | v_0 | v_0 | v_1 | v_0 |
| a | 0 | e_0 | 0 | 0 |
| b | e_0 | 0 | e_0 | e_1 |
| c | 0 | e_0 | 0 | 0 |
| d | 0 | e_1 | 0 | 0 |

Example of Canonical Labeling (Kuramochi & Karypis, ICDM 2001)

- Order based on vertex degree:

| id | a | c | d | b |
|-----------|-------|-------|-------|-------|
| label | v_0 | v_1 | v_0 | v_0 |
| partition | 0 | 0 | 1 | 1 |
| a | 0 | 0 | 0 | e_0 |
| c | 0 | 0 | 0 | e_0 |
| d | 0 | 0 | 0 | e_1 |
| b | e_0 | e_0 | e_1 | 0 |

- Order based on vertex labels:

| id | d | a | c | b |
|-----------|-------|-------|-------|-------|
| label | v_0 | v_0 | v_1 | v_0 |
| partition | 0 | 1 | 2 | 2 |
| d | 0 | 0 | 0 | e_1 |
| a | 0 | 0 | 0 | e_0 |
| c | 0 | 0 | 0 | e_0 |
| b | e_1 | e_0 | e_0 | 0 |

Example of Canonical Labeling (Kuramochi & Karypis, ICDM 2001)

- Find canonical label:

| id | <i>d</i> | <i>a</i> | <i>c</i> | <i>b</i> |
|-----------|----------|----------|----------|----------|
| label | v_0 | v_0 | v_1 | v_0 |
| partition | 0 | 1 | 2 | |
| <i>d</i> | 0 | 0 | 0 | e_1 |
| <i>a</i> | 0 | 0 | 0 | e_0 |
| <i>c</i> | 0 | 0 | 0 | e_0 |
| <i>b</i> | e_0 | e_1 | e_0 | 0 |

| id | <i>a</i> | <i>d</i> | <i>c</i> | <i>b</i> |
|-----------|----------|----------|----------|----------|
| label | v_0 | v_0 | v_1 | v_0 |
| partition | 0 | 1 | 2 | |
| <i>a</i> | 0 | 0 | 0 | e_0 |
| <i>d</i> | 0 | 0 | 0 | e_1 |
| <i>c</i> | 0 | 0 | 0 | e_0 |
| <i>b</i> | e_0 | e_1 | e_0 | 0 |

$$000e_1e_0e_0 > 000e_0e_1e_0$$

(Canonical Label)
